

Your Solution for Maximum Security

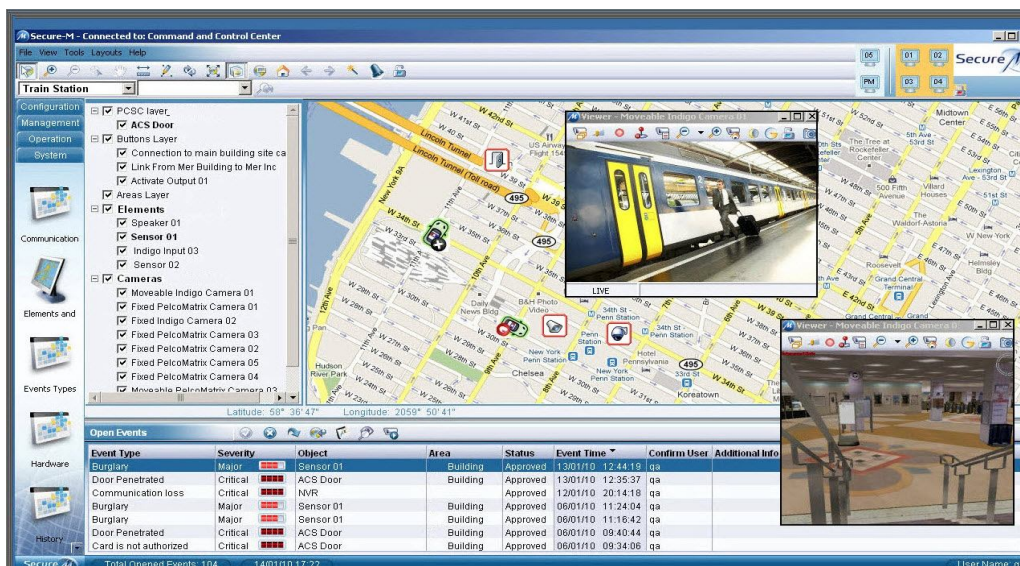

Mer Security's *Secure-M* PSIM Software Wins Mass Transit Magazine

Top Tech Innovations 2010

Fair Lawn, NJ—February 12, 2010—Mer Security, a worldwide leader and innovator in PSIM technology, announces their *Secure-M* PSIM (Physical Security Information Management) technology was named a “Top Technology Innovation 2010” by *Mass Transit* magazine in their February issue. *Secure-M* is Mer’s security and surveillance management system that offers a unified interface with diverse technologies and autonomous devices to allow for a simple, single access to manage and respond to any security alert.

“We received more than 100 nominations and could easily have extended the list,” said Editor Fred Jandt. “It was challenging to narrow it down, but we are confident that this list is made up of an impressive array of innovations that will continue to play a significant role for transit agencies.”

Said Mer’s President, Josef Brikman, “We are very pleased that our software technology is being recognized and acknowledged as a leading solution to the mass transit as well as the wider transportation industry.”

Secure-M is a unified platform that monitors and interfaces with diverse security devices, including but not limited to CCTV, access control systems, perimeter security fences, RFID solutions, motion detectors, 3D GIS layouts, license plate readers, intrusion detection systems, fire alarms, and much more. Secure-M supports interfaces with video analytics and fleet management as well. Companies realize a cost savings with Secure-M, as it is device agnostic and is easily scalable to adding devices in the future.

Most recently, Mer won the project deploying a 3D layout command and control system integrated with *Secure-M* for Israel's Ashdod Port, one of the region's largest, busiest seaports.
